#### Sažetak

Svrha je ovoga rada naglasiti važnost korištenja kolokacija za uspješnije usvajanje jezika i tečniji i prirodniji govor. Izrada lista kolokacija vezanih za djecu s posebnim potrebama mali je doprinos uspješnijoj edukaciji odgojitelja u svrhu višeg zajedničkog cilja, a to je pružanje što boljih uvjeta za rast i razvoj djece, a posebno onoj djeci koja odudaraju u nekim aspektima razvoja od svojih vršnjaka i često su stavljena u nepovoljniji položaj od ostalih. U ovom radu ukratko su opisane sljedeće posebne potrebe: poteškoće čitanja, ADHD, poteškoće iz spektra autizma i sindrom Down. U današnje vrijeme, zahvaljujući napretku u točnom dijagnosticiranju posebnih potreba i stoga povećanom broju dijagnosticirane djece, stručnjaci se u velikoj mjeri bave ovom temom. Jedan od temelja svake profesije, a posebno odgojiteljske je stručno usavršavanje i cjeloživotno učenje, koji podrazumijevaju konstantan rad na sebi i svojim vještinama u svrhu usvajanja novih znanja i uspješnije i kvalitetnije primjene tih znanja u praksi. Jedan od glavnih alata u tom radu je stručna literatura, koja je uglavnom pisana na engleskom kao dominantom jeziku znanstvenih radova. U tu svrhu ovaj rad analizira kolokacije u četrnaest izdvojenih znanstvenih članaka vezanih za posebne potrebe. Iz istoga razloga ovaj rad također donosi manji glosar u kojemu su navedeni neki od najčešćih pojmova vezanih za posebne potrebe s njihovim inačicama na hrvatskom jeziku.

Ključne riječi: kolokacije, poteškoće čitanja, ADHD, poteškoće iz spektra autizma, sindrom Down.

#### Summary

The purpose of this thesis is to emphasize the importance of using collocations as a tool for more successful English language acquisition and more fluent and natural speech. Creating a list of collocations related to children with special needs is a small contribution to more successful education of preschool teachers for the purpose of accomplishing a higher common goal, which is to provide better conditions for the growth and development of children. This is especially important for those children who differ in some aspects of development from their peers, and who are often placed at a disadvantage. The following special needs are briefly described in this thesis: reading difficulties, ADHD, autism spectrum disorder and Down syndrome. Nowadays, thanks to advances in the accurate diagnosis of special needs, and therefore an increased number of diagnosed children, a significant number of experts are showing interest in dealing with this topic. One of the foundations of any profession, especially of preschool education, is professional development and lifelong learning, which implies constant work on oneself and one's skills in order to acquire new knowledge and become more successful at implementing this knowledge in practice. Since one of the main tools in that work is the professional literature, most of which is written in English, this thesis analyses collocations in fourteen scholarly articles related to special needs. For the same reason, this thesis also provides a small glossary, listing some of the most common terms related to special needs with their equivalents in the Croatian language.

Key words: collocations, reading disabilities, ADHD, autism spectrum disorder, Down syndrome.

#### **1. INTRODUCTION**

Special education needs (SEN) have been defined as an individual's difficulty or limitation in the ability to participate in education because of a physical, mental, sensory or learning disability, or some other condition which negatively affects an individual's learning ability compared to a person without that condition (Mihalić, 2013). In addition, special needs may be congenital or acquired conditions which require professional approach in order to enable expression and further development of the preserved abilities, and generally improve a person's quality of life. A child might have potential special needs if there were risk factors involved during pregnancy, childbirth or after childbirth, for example, premature or difficult birth, or if the child is still exposed to adverse conditions in their surroundings, for example, a dysfunctional family, illness of a family member, etc. (Mihalić, 2013). If the child differs significantly from his/her peers in some developmental aspect, for example, because of the child's slower motor skills development or because the child is extremely lively, he or she can temporarily have special needs due to developmental gaps between the child's needs and abilities in specific developmental stages resulting from experiencing some stressful life event. Furthermore, if potential and temporary special needs are not identified on time and properly treated, a child can develop permanent special needs (Mihalić, 2013).

Considering the growing number of children with special needs, more and more studies are conducted and experts have increasingly been dealing with this topic. Hence, it is important for all professionals, especially those working with children, to become acquainted with the terminology used to talk about SEN, primarily in English, in which most of the professional literature is written. One of the aspects of acquiring the terminology are collocations, i.e. combinations of two or more words that often go together or form a fixed relation (O'Dell & McCarthy, 2008). This thesis will therefore provide an explanation of some of the special needs discussed in the selected scholarly articles and give examples of English collocations found in those articles, as well as a small bilingual (English-Croatian) glossary of some of the terms found in the selected journal articles.

#### 2. SPECIAL EDUCATION

Unique individuals, especially those with sensory and physical oddities, have been a part of society since its beginnings. However, in the beginnings, the society perceived such individuals as worthless and not equal to other members of the society, frequently describing them as demons, or seeing their differences as results of some kind of divine punishment. Since then, the shift in social perception has been more positive, and public perception of these individuals has greatly improved. Today, they are perceived as part of the society, and every individual is considered equal while his or her role is regarded beneficial to that society, which, on the other hand, has an obligation to protect and further improve the quality of their life (Rotatori, Oblikor, & Bakken, 2011). Introduction and implementation of inclusion of individuals with special educational needs is one of the reasons their status has changed. Inclusion is a process in which educational institutions and people involved in the education process adjust their practices in order to successfully include individuals with special educational needs into the society begins with proper education of all those who are involved in the educational system (Hayward, 2006).

Over the years, a number of people (Figure 1) have contributed significantly to the development of special education. These pioneers played a major role in raising awareness and giving proper solutions to problems and ways to make life easier for people with special needs as well as tools for educators to further help those individuals.

The start of the twentieth century marks a point at which special education began to emerge in public schools. During that time children as young as five were contributing to their family's prosperity by working in factories, and even basic education for children without special needs was considered a luxury. The situation was even more difficult for children with special needs.

The Individuals	Their Ideas
Jacob Rodrigues Pereine (1715–1780)	Introduced the idea that persons who were deaf could be taught to communicate. Developed an early form of sign language. Provided inspiration and encouragement for the work of Itard and Seguin.
Philippe Pinel (1745–1826)	A reform-minded French physician who was concerned with the humanitarian treatment of individuals with mental illness. Advocated releasing institutionalized patients from their chains. Pioneered the field of occupational therapy. Served as Itard's mentor.
Jean-Marc Gaspard Itard (1774–1838)	A French doctor who secured lasting fame because of his systematic efforts to educate an adolescent thought to be severely mentally retarded. Recognized the importance of sensory stimulation.
Thomas Gallaudet (1787–1851)	Taught children with hearing impairments to communicate through a system of manual signs and symbols. Established the first institution in the United States.
Samuel Gridley Howe (1801–1876)	An American physician and educator accorded international fame because of his success in teaching individuals with visual and hearing impairments. Founded the first residential facility for the blind and was instrumental in inaugurating institutional care for children with mental retardation.
Dorothea Lynde Dix (1802–1887)	A contemporary of S. G. Howe, Dix was one of the first Americans to champion better and more humane treatment of the mentally ill. Instigated the establishment of several institutions for individuals with mental disorders.
Louis Braille (1809–1852)	A French educator, himself blind, who developed a tactile system of reading and writing for people who were blind. His system, based on a cell of six embossed dots, is still used today. This standardized code is known as Standard English Braille.
Edouard Seguin (1812–1880)	A pupil of Itard, Seguin was a French physician responsible for developing teaching methods for children with mental retardation. His training emphasized sensorimotor activities. After immigrating to the United States, he helped to found an organization that was the forerunner of the American Association on Intellectual and Developmental Disabilities.
Francis Galton (1822–1911)	Scientist concerned with individual differences. As a result of studying eminent persons, he believed that genius is solely the result of heredity. Those with superior abilities are born, not made.
Alexander Graham Bell (1847–1922)	Pioneering advocate of educating children with disabilities in public schools. As a teacher of students with hearing impairments, Bell promoted the use of residual hearing and developing the speaking skills of students who are deaf.
Alfred Binet (1857–1911)	A French psychologist who constructed the first standardized developmental assessment scale capable of quantifying intelligence. The original purpose of this test was to identify students who might profit from a special education and not to classify individuals on the basis of ability. Also originated the concept of mental age with his student Theodore Simon.
Maria Montessori (1870–1952)	Achieved worldwide recognition for her pioneering work with young children and youngsters with mental retardation. First female to earn a medical degree in Italy. Expert in early childhood education. Demonstrated that children are capable of learning at a very early age when surrounded with manipulative materials in a rich and stimulating environment. Believed that children learn best by direct sensory experience.
Lewis Terman (1877–1956)	An American educator and psychologist who revised Binet's original assessment instrument. The result was the publication of the Stanford-Binet Scale of Intelligence in 1916. Terman developed the notion of intelligence quotient, or IQ. Also famous for lifelong study of gifted individuals. Considered the grandfather of gifted education.

Figure 1. Pioneering contributors to the development of special education (Source: Gargiulo, 2012, p. 18)

The first special education programs were organized in a way that those children were separated from other pupils, and even in their free time there was no possibility for interaction between them. Children with special needs spent most of their time in the classroom, isolated from school activities. According to Gargiulo (2012), in the second half of the twentieth century after the World War II, the fast progression of special education begins:

In 1948, only about 12 percent of children with disabilities were receiving an education appropriate to their needs (Ballard, Ramirez, & Weintraub, 1982). From 1947 to 1972, the number of pupils enrolled in special education programs increased by an astonishing 716 percent, compared with an 82 percent increase in total public school enrolment (Dunn, 1973). (Gargiulo, 2012, p. 19)

Realisation that dealing with learning disabilities does not require only the usage of drugs and separated specialised institutions, and that there are other, more beneficial ways of dealing with those issues, has been a giant leap in not only inclusion of the individuals who were affected, but also with respect to general human rights.

The end of era of institutional living has been associated with what has been called a "demedicatization" of learning disabilities and a recognition that needs are social and cannot be wholly catered for by doctors and nurses. Concern about the overuse of drugs to manage behavioural problems and the involvement of doctors in the eugenics movement has added impetus to the move away from a medical model. Learning disabilities have come to be understood as a socially constructed condition to which the most helpful response is social inclusion. (Grant, Ramcharan, & Flynn, 2010, p. 33)

Over the years, a number of terms have been used to describe individuals who in some respect differ from others and some of these will be explained on the following pages.

Exceptional child is a term that has often been used to refer to an individual who deviates from common community norms. Most children labelled as exceptional require some sort of individualised educational program. However, it is important to emphasize that this term refers to both children with reduced abilities as well as those with above-average abilities.

For instance, a youngster with superior intellectual ability may require services for students identified as gifted; a child with a visual impairment may require textbooks in large print or Braille. However, we need to make an important point. Just because a pupil is identified as exceptional does not automatically mean that he or she will require a special education. In some instances, the student's educational needs can be met in the general education classroom by altering the curriculum and/or instructional strategies. (Gargiulo, 2012, p. 4)

The concept of normalcy and what is considered normal in social and cultural context can differ from one community to another, and it depends on the characteristics of the group. For example, some behaviours seen as normal and socially acceptable by teenagers may be perceived as abnormal and atypical by middle-aged people. Therefore, Gargiulo (2012) proposes that the concept of normalcy is defined by other people based on their established attitudes and viewpoints.

Another term that has frequently been used is learning disability, first introduced by Kirk (1963), who proposed that,

the child's behavioural symptoms arise from dysfunction of the central processing mechanisms. He described learning disability as a disorder in the development of language, speech, reading, and associated communication skills needed for social interaction. (Gopal, 2013, p. 6)

Learning disability has also been described as a condition which is in some measure caused by genetic ancestry. On the other hand, measuring brain activity has not given any definite results although it is clear that brain activity of people without learning disabilities certainly differs from brain activity of people with learning disabilities, and is further affected by the type of learning disability (Fletcher, 2012). Each person is unique, and there is no certain way of predicting how that person will develop over the course of his or her lifespan. Nonetheless, there are some risk factors and biomedical causes that can be identified, which provide valuable information about the

possibility of developing a syndrome in the future. Biomedical causes that affect the development of the central nervous system and lead to different learning disabilities can be divided into six main categories (Figure 2) (Grant et al., 2010).

Cause	Examples
<b>1 Genetic</b> Chromosomal disorders Syndromes associated with microdeletions Single gene disorders Multifactorial inheritance	Down's syndrome Velo-cardio-facial, Prader-Willi syndrome Tuberous sclerosis, fragile X syndrome, phenylketonuria Neural tube defects
2 Central nervous system malformatic Unknown	ns Sotos syndrome
<b>3 Factors in prenatal environment</b> Toxic Infectious	Foetal alcohol syndrome, maternal rubella, HIV Prematurity, birth injury
<b>4 Disorder acquired around the time of</b> Various	fbirth
5 Disorder acquired postnatally Infections of the central nervous system Accidents Toxins	Measles, encephalitis Brain injury Lead poisoning
<b>6 Unknown cause</b> Learning disabilities associated with other symptoms and signs of brain damage Learning disabilities where low IQ is a quantitative variant of normality	e.g. autism, cerebral palsy

Figure 2. Summary of biomedical classification of causes of learning disabilities (Source: Grant, et al., 2010, p. 39)

Knowing the causes and symptoms may help all those involved to act in a timely and appropriate manner to help an individual exhibiting characteristics of a disability. The main goal of health professionals and family should always be the wellbeing of a child, and the main key to accomplishing that task is the development of good and positive communication and collaboration over the course of child's lifespan. Also, there are associations of parents of children with similar disorders which can offer valuable support and information to each other (Grant et al., 2010).

#### **3. READING DISABILITIES**

The process of reading can be defined "as the identification or recognition of the printed and written text into a meaningful usage of letters, symbols, words and sentences" (Gopal, 2013, p. 3). The dictionary meaning of reading is "the understanding of written text that involves analysis of variety of factors such as syntactic complexity, vocabulary, thematic expression and continuity of themes" (Gopal, 2013, p. 3).

We may conclude that reading is a complex language skill, especially if we know that in order to acquire reading skills, a number of requirements must be met such as: correct and developed oral speech, appropriate graphomotor skills, developed visual and spatial perception, translating graphemes into phonemes blended to form words (Pavličević-Franić, 2015).

When it comes to difficulties related to reading, three main categories of people with reading disabilities have been identified: those individuals that have problems with phonological processing but not with comprehension, individuals with comprehension problems but not with phonological processing, and those with both phonological and comprehension problems (McGill-Franzen & Allington, 2010).

#### 3.1. Dyslexia

"The term dyslexia is comprised of two meanings: 'dys' and 'lexia'. The first blended part incorporates *incorrect* or *inappropriate*, or *misinterpretation* whereas the second blended part incorporates *direction in general*" (Gopal, 2013, p. 9).

Dyslexia has most widely been used to refer to the disorder characterised by serious and persistent struggle with decoding of written language. Dyslexic individuals are unable to develop decoding ability, which is frustrating for them because they have to put a lot of mental effort into reading. This condition is often inherited (Høien & Lundberg, 2013).

The terms dyslexia and reading disability can sometimes be used interchangeably, which is a mistake because

Dyslexia is the term used when the causes of reading disorders are neurological or psychological in nature due to damages caused by any accident or some malfunctioning of the frontal lobe of the hypothalamus. In contrary, the term reading disabilities is used when the causes of reading disorders are psychological or cognitive in nature. (Gopal, 2013, p. 10)

#### 4. ATTENTION DEFICIT HYPERACTIVITY DISORDER (ADHD)

Attention deficit hyperactivity disorder, known as hyperactivity, has been defined as a developmental self-control and attention deficit disorder that is often accompanied by restlessness and impulsivity (McGough, 2014). This means that a person with ADHD has problems with paying attention and controlling impulsive behaviours followed by constant need for some kind of activity and constant restlessness. Another definition refers to this disorder as "a frequently occurring, brain-based, neurodevelopmental disorder with substantial negative consequences for individual and public health. Once viewed as a childhood condition, it is now recognized that a majority of cases persist throughout adolescence and adulthood" (McGough 2014, p. 1).

ADHD is frequently a hereditary condition, and if there are siblings or parents who have had this condition, there is high probability of succession. It is estimated that heritability of ADHD ranges from 60% up to 90% (Ghuman & Ghuman, 2014). Among children, attention deficit hyperactivity disorder is one of the most researched and diagnosed psychiatric disorders.

Three types of symptoms of ADHD have been identified: difficulty concentrating, hyperactivity and impulsivity. Persons affected by ADHD often do not pay attention to details, often make mistakes in everyday tasks, have problems in organisation, and they are often easily distracted while performing some kind of activity. Interrupting others in conversation and play, not being able to perform activity in silence are further signs of hyperactivity and impulsivity (National Institute of Mental Health Information Resource Center, n. d.).

#### 5. AUTISM SPECTRUM DISORDER (ASD)

A significant number of individuals has been found to have autism spectrum disorder. It has been proposed that an increasing prevalence of ASD in the world today is a result of successful diagnosis of this disorder.

"According to the US Centers for Disease Control and Prevention, the current prevalence rate of ASD in the US population was most recently reported to be approximately 11.3 in 1,000 children, or 1.13%" (MMWR, 2012 as cited in Joseph, Soorya, & Thurm, 2014, p. 14). The number is similar for Europe, where it is estimated that around 1% of population is diagnosed with ASD (Joseph et al., 2014).

The main symptoms that describe autism spectrum disorder are absence or lack of social communication skills, and repeating patterns of behaviour and activities (Flanagan, 2008). One of the first symptoms that parents notice are communication problems, which are considered the basis of autism spectrum disorder. Indicators of communication problems and of autism spectrum disorder in general are: decreased eye contact, not responding to name, inability to interact with peers, lack of understanding of social rules and relationships, socially and emotionally inappropriate behaviours (Flanagan, 2008). Limited use of gestures, underdeveloped body language, limited facial expressions usage and perception, and inappropriate grimacing and gesturing are also frequent examples of communication and social skills disruptions (Chauhan, & Brown, 2009).

In addition, autistic individuals demonstrate inability to process certain types of sensory stimuli, which is why they cannot respond to them adequately. They are often hypersensitive to sounds, which causes them to cover their ears in order to block disruptive auditory stimulus (Flanagan, 2008).

Lack of social communication skills and difficulty in forming social relationships can also be seen in their language skills development. "Expressive language function of individuals with autism ranges from complete mutism to verbal fluency" (Chauhan, Chauhan, & Brown, 2009, p. 13). The development of their verbal skills is usually accompanied by semantic problems, literal comprehension and misunderstanding of communicated messages.

#### 6. DOWN SYNDROME

Down syndrome is named after John Langdon Down, British physician who was the first person to describe characteristic features of this syndrome in 1866. In 1958 Professor Jerome Lejeune identified Down syndrome as a genetic disorder caused by triplication of the 21<sup>st</sup> chromosome, and not a racial degeneration as had previously been thought (Fish, 2008).

It is important to use the right terms while describing a child with Down syndrome. The preferred term is 'Down syndrome' and 'child with Down syndrome' because Dr. Langdon Down did not have the syndrome himself, so it is wrong to call it 'Down's syndrome', secondly, it is important to describe a child's condition by focusing on the fact that an individual affected by this syndrome is first and foremost a child, and that having a syndrome is secondary by importance (Selikowitz, 2008).

Down syndrome is one of the most common congenital syndromes, which is caused by an abnormal development of foetus and it is present at birth. Disorder occurs roughly once in every 700 births, and it is present in all ethnic groups. There are slightly more males than females affected by this disorder, but this difference is negligible. Doctors can recognize Down syndrome shortly after a child is born, based on child's appearance, but chromosome tests are needed in order to confirm those suspicions. These are characteristic features of individuals affected by Down syndrome:

When looked at from the front, the child with Down syndrome usually has a rounded face. From the side, the face tends to have a flat profile.

The back of the head is slightly flattened in most people with Down syndrome. This is known as brachycephaly.

The eyes of nearly all children and adults with Down syndrome slant slightly upwards. In addition, there is often a small fold of skin that runs vertically between the inner comer of the eye and the bridge of the nose

The hair of children with Down syndrome is usually soft and straight. Newborn babies with Down syndrome may have excess skin over the back of the neck, but this is usually taken up as they grow. Older children and adults tend to have short, broad necks. (Selikowitz, 2008, p. 29)

Children with Down syndrome usually weigh less than average at birth. Their length at birth is similarly reduced. During childhood, they grow steadily but slowly, and their ultimate height as adults is generally shorter than would be expected for their family. It is usually near the bottom of the normal range, and is approximately 145–168 cm in men and 132–155 cm in women. (Selikowitz, 2008, p. 31)

All children with Down syndrome have some kind of intellectual disability that can range from mild symptoms to severe ones. In contradiction to popular belief, children with Down syndrome may differ significantly from one another, and the differences range from colour of their hair, facial features to temperament inherited from their parents or wide range of abilities. It is wrong to generalize characteristics of those individuals because every person affected by this disorder is unique in his or her own way (Selikowitz, 2008).

As shown in Figure 3, the rate of development of a child with Down syndrome is significantly slower than that in children without disorder. Rate of development also varies between individuals. Adults with Down syndrome can be independent in their adulthood, but they will also need more help than an average person in their everyday life.

Figure 3. Rate of development of a person with Down syndrome (Source: Selikowitz, 2008, p. 44)

Language development of individuals with Down syndrome is much slower than other areas of development. Babies with Down syndrome are very responsive to the sounds they hear, and show typical reactions for newborn babies. On average, children with Down syndrome will pronounce their first words by the age of two (Figure 4). A speech therapist can help a child that has particular difficulty in acquiring language by teaching him or her hand sign language. This is important because the use of hand sign language reduces their frustration and further helps in language development (Selikowitz, 2008).

	Down syndrome		Normal	
	Average age	Age range	Average age	Age range
Language				
First word	23 months	1–4 years	12 months	8–23 months
Two-word phrases	3 years	2-7½ years	2 years	15-32 months

Figure 4. Rate of language development of a child with Down syndrome compared to a normally developing child (Source: Selikowitz, 2008, p. 48)

#### 7. ACADEMIC STYLE

Globalisation of university education and diversity in the educational context have led to establishing English language as the predominant media of instruction. English for academic purposes may be divided into two sub-categories: English for general academic purposes (EGAP) and English for specific academic purposes (ESAP) (De Chazal, 2014). "ESAP can cover variety of types of English for specific academic and professional purposes, such as English for law, architecture, or nursing" (De Chazal, 2014, p. 6).

Development of English for special purposes (ESP) goes back to 1960s, and its representatives were several countries including: UK, Canada, USA, Chile, Thailand and India, where Englishmedium education was present. English for academic purposes (EAP) developed as a result of an increasing number of students whose native language was not English going abroad to study. For a long period of time, development and practicing of EAP occurred mostly in major English-speaking countries, led by the USA, Canada, UK, Australia. However, as "Many students had a level of English which was too low for academic study in English, as well as a limited background in academic English culture and practices" (De Chazal, 2014, p. 9), the main purpose of EAP became to resolve that issue. Today, English-medium universities are being founded all over the world. Both ESP and EAP are mainly directed by student's specific English language learning goals (De Chazal, 2014).

"As its name suggests, English for academic purposes involves the teaching and learning of English language so that students can operate effectively in the disciplines, i.e. in their specific subject(s) in an academic institution, typically a university" (De Chazal, 2014, p. 10).

Learning academic and disciplinary vocabulary is a fundamental task for first and second language learners of EAP, and for that purpose it is important to learn to recognise and use vocabulary related to specific discipline (De Chazal, 2014). Vocabulary studies related to academic texts highlighted a need for certain vocabulary knowledge in order to increase success in lecture realization (Hyland & Shaw, 2016). Academic Collocation List presented by Ackermann and Chen (2013) is a list containing 2,468 most frequently used pedagogically related collocations.

"Collocations in this list are defined as words that co-occur plus or minus 3 words from the node word and include noun, verb plus noun/adjective, verb plus adverb, and adverb plus adjective combinations." (Hyland & Shaw, 2016, p. 169). On the other hand, even though academic collocation lists are an important factor in learning and teaching EAP and ESP, vocabulary relevant for one discipline does not have to be relevant for another, so it is important to create discipline specific collocation lists (Hyland & Shaw, 2016).

"Dang and Webb (2014) recommend knowledge of the most frequent 4,000 word families (95 percent coverage) as the minimum vocabulary size a learner should have to adequately comprehend academic aural texts" (Hyland & Shaw, 2016, p. 169).

As part of any language, especially when translating from one language to another, and even more so in the language for specific and academic purposes, collocations are a useful tool for every language learner. This is why they will be further explained in the following chapter.

#### 8. COLLOCATIONS

In 1930s, British linguist John R. Firth was the first person to give prominence to collocating words and to popularize the term *collocation*. The word collocation comes from the Latin verb *collocare*, which translates as *to arrange; to set in order*. In other words, the term collocation is used to define a way in which lexical items occur together (Müller, 2008).

Collocation generally refers to the expression of words which are often used together such as bitterly cold, rich imagination or close friends. If you hear the first word, the second can be expected, or at least you can have an idea what it could be. (Müller, 2008, p. 4)

Even before the accomplishments of John R. Firth, pedagogical studies related to learning first and second language were occupied by collocations, seen as one of the dominant tools for accomplishing fluency in a language. In the early years of the twentieth century, a pioneer of study of English as a Foreign Language, Harold Palmer, identified and wrote down over 6,000 frequently used collocations, which were later on memorised in blocks by students and used in learning the English language. Collocations are manly a product of pedagogical studies of the language learning that identified them as indicators of high level of competence which can be achieved by their memorisation, a benefit that was seen as unattainable by non-native English language speakers (Seretan, 2011).

According to statistical approach (Seretan, 2011), in order for collocations to be more easily memorised, they need to be recognisable based on how often they come together to be observed as regular word combinations. If words often come together, it will be easier for English language speakers to memorise them. Most of the collocation definitions embrace statistical viewpoint even though collocation as language term has an implicit linguistic connotation. On the other hand, linguistic approach views collocations as expressions of a language, focusing on the fact that words that participate together need to be linked syntactically, which requires them to be within a short space of each other (Seretan, 2011). "In contrast with the statistical approaches, the collocation is seen here as a directed (asymmetrical) relation, in which the role played by the participating words is uneven and is mainly determined by the syntactic configuration of the collocation" (Seretan, 2011, p. 13).

In addition to the abovementioned approaches to collocation studies, we may find two main types of collocations: strong and weak (O'Dell & McCarthy, 2008). Strong or fixed collocations have a fixed and limited bond, i.e. the words are closely related to each other and the relation between them is firmly established (Figure 5). Fixed collocations have a strong link that cannot be changed under any circumstances. "For example, you can say I was walking *to and fro* (meaning I was walking in one direction and then in the opposite direction, a repeated number of times)" (O'Dell & McCarthy, 2008, p. 8). In this example of fixed collocation, *to, and* or *fro* cannot be replaced by any other word.

collocation	comment
<b>Inclement weather</b> was expected.	(very formal) = unpleasant weather Inclement collocates almost exclusively with weather.
She has <b>auburn hair</b> .	Auburn only collocates with words connected with hair (e.g. curls, tresses, locks).
l felt <b>deliriously happy</b> .	= extremely happy Strongly associated with <i>happy</i> . Not used with <i>glad</i> , <i>content</i> , <i>sad</i> , etc.
The chairperson <b>adjourned the meeting</b> .	= have a pause or rest during a meeting/trial Adjourn is very strongly associated with meeting and trial.

Figure 5. Examples of strong collocations (Source: O'Dell & McCarthy, 2008, p. 8)

Weak collocations, on the other hand, are words that can collocate with a broad spectrum of other words. "For example, you can say you are **in broad agreement** with someone [generally in agreement with them]. However *broad* can also be used with a number of other words - **a broad avenue**, **a broad smile**, **broad shoulders**" (O'Dell & McCarthy, 2008, p. 8). The word *broad* is a weak collocation because it collocates with large number of different nouns.

As shown in Figure 6,

Strong collocations and weak collocations form a continuum, with stronger ones at one end and weaker ones at the other. Most collocations lie somewhere between the two. For example, the (formal) adjective *picturesque* collocates with *village*, *location* and *town*, and so appears near the middle of the continuum. (O'Dell & McCarthy, 2008, p. 8)

stronger ← inclement weather

picturesque village picturesque location -→ weaker broad hint broad accent broad smile

Figure 6. Continuum between stronger and weaker collocations (Source: O'Dell & McCarthy, 2008, p. 8)

The following are grammatical categories of collocations according to O'Dell and McCarthy (2008, p. 10) with some examples from the articles analysed in the following two chapters.

adjective + noun
mainstream classroom
cognitive skills

noun + noun
peer group
risk factors
peer gro

verb + noun
develop a disorder
meet criteria

noun + verb
studies fail to support
reports reveal

verb + adverb (adverb + verb)
anatomically connect
decrease significantly

adverb + adjective
highly consistent
spatially transformed

In the next chapter some English language collocations related to special education are presented according the abovementioned grammatical categories and grouped by special needs.

## 9. ANALYSIS OF COLLOCATIONS BY GRAMMATICAL CATEGORY AND TYPE OF SPECIAL NEED

#### 9.1. Dyslexia

adjective + noun		
beginning		
fluent		
normally developing	readers	
poor		
struggling		
initial	letters	
persistent	difficulties	
phonemic	awareness	
phonological	recording	
phonological	skills	
structural		
visual	cues	
nonsense		
unfamiliar	- words	
upcoming		

noun + noun	
coding	skills
decoding	581115
letter-sound	knowledge
literacy	development
phoneme	awareness
reading	acquisition
	development
	difficulties
	failure
	intervention
sentence	processing
word	recognition

verb + noun	
cause	problems
complete	blocks of practice
define	dyslexia
result in	
identify	(unfamiliar) words
oppose	the recognition

recognize	the condition
-----------	---------------

noun + verb	
condition	arises
	is associated
dyslexia	includes
	arises
miscue analysis	was introduced
multiple cues theorists	assume
phonological decoding	was measured
prereaders	demonstrate
reading acquisition	is seen
spinoffs	include

adverb + verb (verb + adverb)	
affect	adversely
formally	recognize
greatly	influence
present	shortly
read	incorrectly
recognize	accurately
rely	heavily
subsequently	develop

adverb + adjective	
attentionally	demanding
clinically	significant
less	able
more	generic
	productive
severely	limited
typically	
widely	accepted

## 9.2. ADHD

adjective + noun	
appropriate social	
delinquent	
disruptive	
hostile	behaviour
impulsive	
maladaptive	
mindful	
	deficit
a a mitima	impairments
cognitive	tasks
	weaknesses
	diagnosis
comorbid	disorder
	mood
davalonmental	disorders
developmental	impairments
emotional	control
	impairments

	reactions
frequent	interrupting
	conduct
impaired social	interactions
neurobehavioral	disorder
oppositional defiant	disorder
neurological	
sensory	impairments
underlying cognitive	
neuropsychological	deficits
temporal processing	denens
poor	self-regulation
	inhibition
sustained	attention

noun + noun	
attention-deficit/hyperactivity	disorder
behaviour	therapy
childhood	ADHD
conduct	disorder
	problems

hyperactivity	
impulsivity	symptoms
impairment	pattern
inattention	subtype
	symptoms
management	strategies
mindfulness	training
paying	attention

verb + noun	
address	ADHD
assess	(visuo-spatial) memory
develop	substance use disorders
divide	
maintain a focus on	attention
express	anger
	frustration
impose	control
lack	friendship

noun + verb	
	arises
ADHD	may include
	may involve
disability	contributes
disorders	may arise
emotional impairments	include
functions	facilitate
training	is movided
treatment	is provided

verb + adverb (adverb + verb)		
act	hastily	
speak		
change	substantially	
	successively	
effectively	participate	
measure	effectively	
perform	slightly	
respond	appropriately	
robustly	relate	

	•	11	
typ	11C	ลป	V
21	<i>J</i> 10	un	L Y

focus

adverb + adjective		
highly	heritable	
	dispersed	
less	responsive	
mentally	difficult	
physically		
moderately	effective	
reasonably		
more	avoidant	
	hostile	
socially	acceptable	
typically	characterized	
	developing	
	focused	

### 9.3. Autism spectrum disorder

adjective + noun		
adaptive	functioning	
alternative	communicating	
atypical	nonspeech sounds	
augmentative	methods	
nonaugmentative		
developmental	regression	
fixed	phrases	
interactive	exchanges	
nonverbal	abilities	
repetitive	behaviour	
restricted		
scripted	language	
spoken		
stereotyped		
social	engagement	
	exchange	
	functioning	
	interactions	

	relationship
verbal	abilities
	children

noun + noun	
autism	intervention
communication	skills
developing	imitation
engagement	activities
imitating	others
sharing	emotions
sign	language
skill	patterns
vowel	approximations

verb + noun	
acquire	language
assess	lunguage
address	limitations
base (something) on	scores
	report

develop	awareness
	behaviour plan
follow	developmental paths
have	deficits
identify	signs
point to	something
promote	(affective) engagement
receive	instruction

noun + verb	
assessing (skills)	facilitates
efficient methods	facilitate
focus	shifts
information	can be found
	has been described
interventions	consider
	emerge
	incorporate
	target
	vary
scaffolding	involves

techniques	
------------	--

include

verb + adverb (adverb + verb)	
actively	
effectively	engage
commonly	report
learn	most easily
objectively	
systematically	verify
readily	implement
slowly	acquire
strategically	design
use	independently

adverb + adjective	
affectively	engaged
	rich
considerably	lower
developmentally	appropriate
socially	
generally	paired

minimally	verbal
more	compliant
overly	restricted
previously	acquired
	described

adjective + noun	
aging	process
cardiac	defect
cognitive	impairment
congenital	anomalies
endocrine	systems
enhanced	quality
excessive	skin
extra	chromosome
facial	appearance
	features
familiar	characteristics
genetic	counselor
heavy	breathing
hematologic	abnormalities
immune	deficits
innate	capacities
multiple	comorbidities
musculoskeletal	disorder

neurologic	dysfunction
obstructive	sleep
poor	sheep
physical	features
prenatal	diagnosis
social	situations

noun + noun	
body	composition
chromosome	evaluation
daytime	sleepiness
detection	
morality	rate
obesity	
feeding	issues
	problems
heart	defect
	disease
life	expectancy
	quality
lobe	dysfunction

screening	tests
sleep	disorder
Sheep	position
support	systems
weight	loss

verb + noun			
give	a prenatal diagnosis		
improve	health		
lead to	extension		
maintain	follow-up		
measure	TSH		
offer	guidance		
	assurance		
provide	care		
	counseling		
suspect	the diagnosis		

noun + verb		
adaptive behaviour	encompasses	
areas	require	

children with DS	display (facial features)
dementia	was linked
estimates	suggest
families	benefit from
first trimester screening	incorporates
improvements	lead
rates	double
risk factors	are identified

verb + adverb (adverb + verb)		
affect	early	
commonly	observe	
follow	longitudinally	
function	more effectively	
improve	significantly	
promptly	refer	
typically	show	

adverb + adjective		
clinically	normal	
currently	estimated	
occasionally	severe	
particularly	common	
possibly	attributable	
potentially	modifiable	
socially	deficient	
typically	developing	

## **10.** SPECIAL EDUCATION GLOSSARY

For the purpose of this thesis, we have selected some terms found in the selected articles and listed them in the glossary. The glossary includes terms related to special education, their definition in the English language, Croatian translation of the term and its definition in Croatian.

Term in English	Definition in English	Term in	Croatian translation of
		Croatian	the English definition
acquired disorder	Acquired disorder is a	stečeni	Stečeni poremećaj je
	disorder that is not	poremećaj	poremećaj koji nije
	congenital and develops	(generally	urođen i razvija se nakon
	after birth.	accepted	rođenja.

## **11. CONCLUSION**

In conclusion, after years of unfair treatment of children with special needs, society has finally reached that step where most of the professional workers have realised the importance of inclusion of special education needs children in mainstream classrooms. We can all agree that there is still much to be done, and it is a duty of every single one of us to do our best to contribute to our common goal.

In order to improve our workplace and create an inviting surroundings for all children, and especially children with special educational needs, teachers have to start by improving themselves. Professional literature, which is for the most part written in the English language, is one of the main tools in expanding one's knowledge and improving skills in every profession. The importance of successful use of professional literature is even greater in preschool profession because of the enormous responsibility early childhood and preschool teachers have.

Learning collocations is one of the first steps in later professional education and successful analysis and usage of written texts. Collocations have been defined as combinations of words that sound "right" to most English language speakers, and for those who are not certain about their use, it is important to learn which words collocate in order to make one's speech sound more natural and easier to understand and to better understand a written text. This is why some of the relevant examples of collocations have been presented in this thesis. The most widely used collocations in the analysed scholarly papers in all of the sections related to different special needs (dyslexia, ADHD, autism spectrum disorder and Down syndrome) are adjective + noun collocations, whereas the least frequent ones are noun + verb collocations.

In this thesis a small bilingual glossary that includes terms related to special education in both English and Croatian language was also proposed and presented with explanations of the selected terms in both languages. It is our hope that this thesis will, at least to a small extent, facilitate early childhood and preschool teachers' use of academic texts and thus contribute to their professional development, so that they might provide the best care and education for children.

Izjava o samostalnoj izradi rada

Ja, dolje potpisani, Mihael Antolić, izjavljujem da sam samostalno napisao završni rad. U izradi završnoga rada vodstvom i savjetima pomogla mi je mentorica doc. dr. sc. Alenka Mikulec te joj ovim putem zahvaljujem. Također zahvaljujem i izv. prof. dr. sc. Jasni Kudek Mirošević na pomoći pri izradi dvojezičnoga glosara s terminima vezanima uz odgoj i obrazovanje učenika s posebnim odgojno-obrazovnim potrebama. Izjavljujem da ni jedan dio ovoga rada nije napisan na nedozvoljen način te da je sva korištena literatura navedena prema pravilima.
